Electricity Saving Measures for the Summer 2012

INPEX CORPORATION announced that in order to meet possible power shortages this summer in Japan it plans to reduce electricity consumption by approximately 30% than the level 2010, following the same initiatives taken last year, at the operation sites and the offices in the areas where electricity is supplied by Tohoku Electric Power Company, Tokyo Electric Power Company and Chubu Electric Power Company.

- Operation Sites
 - Reduce outsourced electricity supply by using in-house power generation of Koshijihara plant (natural gas production plant).
 - Try not to carry out operations that use outsourced electricity at peak hours.
 - Replace some of the operational equipment to those of energy saving types.
 - Supply electricity to grid power by using excess capacity of in-house power generation of Koshijihara plant and Koshijihara electric generation plant.

- Offices etc.
 - Set the airconditioned room temperature at two degrees Celcius higher than the original settings.
 - Reduce light, and turning off the lights at lunch hours and after office hours.
 - Minimize the standby electricity of personal computers.

INPEX continues to enlighten employees on the importance of electricity savings by informing the demand of electricity consumption at company's operation sites and offices and introducing electricity saving measures at home.
